The future already
exists, and at
Thronus it is where it

Goal

Amidst a decentralized and global financial and technological market, several currencies emerge. Only a few are outstanding on the market, and our objective is being primordial in cryptocurrencies' quality. For this, we are developing a encryption project is being developed using the blockchain technology (transparent and fast network, working as an extremely safe chain of blocks, utilized for financial transactions), called Thronus.

The Thronus project consists of starting as an ICO (Initial Coin Offering). It is a mechanism used to facilitate the development of new cryptocurrencies. That is, the currency starts as an ICO, but with the market evolutions, it can be consolidated. The intention is to make it a strong currency in the market.

Thronus will use an blockchain update through Bitcoin Forks. Blockchain's fork will receive a series of updates by our team enhancing the functioning code, to guarantee meaningful enhances in our cryptocurrency that is on its way. The Fork is a kind of "bifurcation" that improves the currency's protocol. It is a transaction and exchange facilitators. Therefore, THR will have upgrades on its algorithm that will allow more forks to be created.

Technology Applied

To accomplish the currency's functions, the Blockchain technology will be essential. This technology develops solutions for every kind of business, presenting high performance and agility in its system.

In the case of the Thronus ICO, we will use our Blockchain Fork to make easy exchanges, negotiations, and transactions. Our technology applied to this Fork will have great practicality and the possibility of growth of the cryptocurrency Thronus.

A blockchain technology will be developed based on a Bitcoin Cash Fork. The network will be safe and fast, bringing more independence of usage and amplification perspective. The data bank will be safe and transparent.

Opportunity

The Bitcoin world emerged as a rumble of thunder, and only a few saw it coming, but its effect was noticed by everyone. The blockchain proved that it is possible to have transparency over businesses that are desired by bad-intentioned people. In these systems, the users look for platforms that provide better quality services and with promising expectations.

We came up with the idea of making the cryptocurrency universe even more versatile, offering the automated trading process, as we understood the great openness regarding the quick buying and selling of cryptocurrencies. The work on the automation of our service allows the users to not need so much maintenance over their finances, leaving aside the high preoccupation with the volatility of the cryptocurrencies. Making the trading, in the cryptocurrency market, faster makes its valuation reach higher levels in less time.

Solutions

We believe in a quicker and more practical cryptographic market. We have already understood that the cryptocurrency market has come to revolutionize the means of financial transactions. Now we want to go further. The manual trading activities, in a way, made the users stay at the mercy of their willingness to exchange and sell their cryptocurrencies, which could reduce the number of transactions, reducing the circulation of the virtual currency and consequent loss of time for its valuation. That way, our solution is more transaction, in less time.

With our automated trading technology, the users can trust their investments in our platform, making their transactions without further worries. With automated earnings, profitability has a strong ally.

We want to contribute to the earnings of our investors by providing that platform fluidity, and wherever it is, your income is increasing.

ICO Thronus

ICO (Initial Coin Offering) is a mechanism used to finance the development of new cryptocurrencies. This offer can be considered as crowdfunding (collective funding with multiple sources).

Therefore, we offer a solid, highly technological and very well planned project that will provide a practical and effective solution to a global problem, exchange rate, and international negotiations, we offer THRONUS.

In addition, ICOs are great growth opportunities and do not require large regulations and bureaucracies (like other types of negotiations), facilitating the system's steps and processes.

Thronus has come to bring all the practicality that an ICO can offer and can play a role of extreme relevance in the financial universe. The idea is, after the ICO period, to implement a cryptocurrency with its own blockchain technology. This news will be based on a Bitcoin cash fork and will make it easier to execute trades.

You can follow the development of ICO through our website and make purchases in it. In addition to the growth of crypto, the negotiators will be able to observe their own evolutions in this market.

Mining

Thronus Coin, as a cryptoasset, relies on the security protocol “proof-of-work” mining to gain assent in its distribution. This way of mining structure is a protocol that aims to prevent any cybernetic frauds, in this case, linked to the universe of cryptocurrencies. Therefore, the performance of actions on the platform depends on the user’s ability to perform a complex problem of being solved and easily verifiable by the other subjects connected to the network.

In general, the mining of Thronus Coin resembles the others when considering some basic requirements. The miner must have a card to insert into specific computers and hardware, allowing the user to use a common CPU to mine the cryptoasset. Once you have the card, the individual must open a digital wallet to store and protect their mined money. In addition, it is worth noting that the larger the number of data encryption systems, the safer the wallet.

Thronus sought to advance its protection tools, differentiating its code from the most famous of the category, Bitcoin. The code used by the new cryptocurrency, the TMR (Fork of the XMR) was chosen to act in order to prevent the creation of specific chips for the accomplishment of the mining calculation. In this way, processors of any computer can make significant and profitable contributions in the mining of Thronus. In turn, the compatible softwares for currency mining are XMR Stak, XMRig, XMRig AMD, and XMRig NVIDIA.

Therefore, Thronus Coin emerges as the proposal of providing ease and security in its mining, bringing greater accessibility to those who want to operate in the market of cryptoassets with conventional computers. Such readiness envisages bringing with it the exponential growth of the currency and consequently increasing the earnings of its users.

Lending

With similar features to the airdrop system, the lending allows the user to get periodical profits through the provision of the cryptoassets in the platform. This is, instead of storing your cryptocurrencies in a wallet, the client deposits the assets in our lending in a period of 12 months, getting even more significant profits.

Specification

Início ICO	Thronus
Ticket	THR
Início ICO	10/June
Maximum Amount	1.000.000.000 THR
Initial Sales	0,10 USD
End Sales	0,20 USD
Maximum Sale	300.000.000 THR
Blockchain	Fork BCH
Wallet initials	T

Strategies

There are 1 billion THR available. Its distribution of the amount will be made in three steps: sales, mining, and developers.

ICO Distribution

Roadmap

- 07/11 and 07/12 — ● — **1st ROUND** \$0,10 (100,000,000)
- 07/13 and 07/14 — ● — **2nd ROUND** \$0,15 (150,000,000)
- 07/15 and 07/16 — ● — **3rd ROUND** \$0,20 (200,000,000)
- 07/17 — ● — **FINAL ROUND** \$0.25
- 10/09 — ● — **Mining**
- 20/09 — ● — **Lending**
- 10/10 — ● — **Exchanges e Plataformas**
- 10/11 — ● — **Coin Market Cap**
- 20/11 — ● — **Roadmap Future**
